

Marine Biodegradable Drinking Straws

Meet phade® – some very special straws created from nature, for nature. Once composted, they return to the environment. That’s because they’re made with PHA, a material derived from canola oil, making them strong, sturdy, and sustainable.

People-Pleasing, Planet-Protecting Straws.

phade® straws are the best of both worlds. They look, feel, and function like traditional plastic straws, but when composted, completely biodegrade. If a phade® straw were to unfortunately end up in the ocean, it would sink and biodegrade in a few months, compared with the 200+ years it takes for petroleum-based plastics to go away, protecting millions of marine species in the process.
